

## Homework assignment

Create a REST api for bank account handling in Java, Spring Framework:

- add money to account
- debit money from account
- get account balance
- currency exchange (for simplicity with fixed prices for different currencies)

Requirements:

- account can have multiple currencies (eur, usd, sek, gbp) with separate balance
- debiting order can only use one currency (no automatic currency exchange)
- before debiting, simulate a call to external system (ie. external logging) by calling some web page (like <https://httpstat.us/>)
- microservice (self contained)
- saved in db (pick your own, h2 is ok)

Additionally:

- you will need to present your home assignment during tech interview and address the related questions.
